

Abstract

Gender wage inequality remains a significant issue across many organizations and industries worldwide. This project analyzes gender pay gap data to identify patterns of wage disparities between male and female employees. The dataset contains company-level information including hourly pay gaps, bonus distributions, and employee distribution across salary quartiles.

Exploratory Data Analysis (EDA) techniques were applied using Python libraries such as Pandas, Matplotlib, and Seaborn. Various visualizations including histograms, bar charts, and heatmaps were used to analyze trends.

The results indicate that many organizations exhibit a positive gender pay gap, where male employees earn higher wages compared to female employees. Male employees are more represented in higher salary quartiles, while female employees are more concentrated in lower salary ranges.
